

CARBON REMOVAL PURCHASE AGREEMENT

	Purchase overview				
Description	Stripe, Inc. (known as “ Stripe ”), Shopify, Inc. (known as “ Shopify ”) and Google LLC (known as “ Google ”, together with Stripe and Shopify), will purchase 2,142 metric tons of carbon dioxide removal from the first year of operation of Karbonetiq’s passive surficial mineralization system at pilot sites in Contrecour and Sault St. Marie, Canada. The project is detailed in full here.				
Type	Mineralization				
Purchase amount	\$750,000				
Service quantity	2,142 metric tons				
Price	\$350 / metric ton				
Estimated delivery schedule	The Original Purchase Amount will be allocated according to the following schedule: <table border="1"> <thead> <tr> <th>Year</th><th>Quantity (Net metric tons of CO₂ removed)</th></tr> </thead> <tbody> <tr> <td>2026</td><td>2,142 metric tons</td></tr> </tbody> </table>	Year	Quantity (Net metric tons of CO ₂ removed)	2026	2,142 metric tons
Year	Quantity (Net metric tons of CO ₂ removed)				
2026	2,142 metric tons				
First customer? <i>(alongside other Frontier buyers)</i>	No				
Largest customer? <i>(Frontier buyers combined)</i>	No				
Estimated delivery start & completion	July 2026 - December 2026				
Interim milestones & payment schedule	We anticipate these steps will be important markers of progress toward delivering carbon removal. Subject to Section 2.1 below, Company will provide evidence of the following milestones, and Buyer will pay Company’s undisputed, properly submitted invoice(s) within 60 days of receiving them, pursuant				

to the payment instructions of Company:

Payment (USD)	Milestones	Estimated date
\$750,000	Upon execution of the agreement	July 14, 2025
\$0	Complete installation of Karbonator technology and carbonation sampling setup.	September 2025
\$0	Commence operations and reach processing capacity of 20,000 tons across Contrecoeur and other active pilots.	October 2025
\$0	Complete pilot facility validation audit. Conduct sampling, quantification, and verification of net removal in line with the procedures in Isometric's Open System Ex-Situ Mineralization protocol or Puro.Earth's Carbonated Materials methodology.	February 2026
\$0	Notify Frontier of first tons removed for this agreement. Publish internal whitepaper with conclusive, statistically significant data on carbonation rates under ambient, field conditions across target feedstocks in (1) baseline control plots, (2) a process with incremental crushing, and (3) a process with the Karbonator system. Publish a subset of findings externally.	July 2026

Additional inventory purchase overview

Description

Stripe, Inc. ("**Stripe**") will have the option to purchase an additional 17,450 metric tons of carbon dioxide removal from 3 years of operation

	for the project described above in order to help secure additional sales for the Company beyond the Original Carbon Removal Purchase. Stripe will have the right to sell any amount of such additional purchase to a third party.												
Additional inventory estimated delivery schedule, price, and quantity	The Additional Inventory will be allocated according to the following schedule: <table><tr><th>Year</th><th>Price</th><th>Quantity (Net metric tons of CO₂ removed)</th></tr><tr><td>2026</td><td>\$350 USD / ton</td><td>1,736 metric tons</td></tr><tr><td>2027</td><td>\$325 USD / ton</td><td>5,000 metric tons</td></tr><tr><td>2028</td><td>\$275 USD / ton</td><td>10,000 metric tons</td></tr></table>	Year	Price	Quantity (Net metric tons of CO ₂ removed)	2026	\$350 USD / ton	1,736 metric tons	2027	\$325 USD / ton	5,000 metric tons	2028	\$275 USD / ton	10,000 metric tons
Year	Price	Quantity (Net metric tons of CO ₂ removed)											
2026	\$350 USD / ton	1,736 metric tons											
2027	\$325 USD / ton	5,000 metric tons											
2028	\$275 USD / ton	10,000 metric tons											
Payment schedule	Subject to Section 2.2 below, any Additional Purchase Amount will be payable quarterly at the end of each quarter.												

Pre-conditions for future purchase	
Description	Upon Company achieving all of the conditions related to the Original Carbon Removal Purchase below, Buyer, or an affiliate thereof, for itself or in connection with Frontier, may enter into negotiations for a new offtake agreement. These criteria summarize what would make us excited about the further trajectory of this project. However, at our discretion, we may be willing to engage in this conversation earlier - especially if it would meaningfully advance your progress.
General	• Delivery of 100% of initial tonnage, with third party measurement, reporting, and verification (MRV) evidence of tons removed. Public reporting of tons delivered, price per ton, and protocol used at time of delivery • Completion of a third-party lifecycle analysis (LCA) to confirm the net tons removed for this project • Updated LCA for future deployments that demonstrate declining future process emissions and improving net negativity

	• Updated techno-economic analysis (TEA) providing significant evidence that a sub-\$100/ton capture cost by the date projected in the application to Frontier is achievable and highlighting key cost sensitivities. Differences between current experimental values and TEA assumptions for \$100/ton highlighted, including a plan to narrow the gap between actual and modeled performance is presented • Evidence of ongoing responsible community engagement and efforts to achieve the highest standards of safety, compliance, and local environmental outcomes • Meeting with Frontier and potential site visit upon delivery and achievement of project-specific renewal conditions to answer any questions about the results
Project-specific	• Achieve 0.5%-1.0% CDR/m²/week by optimizing Karbonator system design and mineralization process — e.g. particle size, particle distribution, tilling/refresh rate, slag bed shape, aeration geometry. • Publish results from benchtop reactivity rate analysis across heterogeneous feedstocks that demonstrate the system can be used cost effectively beyond steel slag feedstocks. • Provide revised deployment strategy and under which conditions to install Karbonators based on system performance, fabrication cost, operational cost, and material reactivity at top sites.
